Trans. of Aerotecnica (Italy) [1957] v. 37, p. 311-320.

By starting from the simplified equations and the hypotheses on which the Prandtl boundary layer theory is based, a study is made of the two problems essentially governed by these equations: (1) the boundary layer with injection of fluid; and (2) the interaction of the two streams. The equations are integrated by introducing polynomial developments for the profiles of velocity, concentration and enthalpy. The investigation, devoted to the general case, examines boundary layer thicknesses nonzero at the beginning of the interaction of the two streams, in the latter. Anatomically, the adrenal cortex shows an enormous,
nodular and wrinkled hyperplasia. With exception of
sparse subcapsular and juxtamedullary areas the corti-
cal cells are distended with cholesterol and other li-
poids. They contain no histo-chemically detectable
ketosteroids. The demonstrated results suggest that
